

What is claimed is:

1. An optical transmission system comprising:
 - an optical terminal;
 - an optical-fiber transmission line
 - 5 connected to the optical terminal; and
 - an optical repeater arranged along the optical-fiber transmission line;
 - the optical terminal includes,
 - an optical-signal power detection unit
 - 10 which detects power of optical signals transmitted from the optical terminal in each of a plurality of gain bands,
 - a tone-signal generation unit which generates a plurality of tone signals respectively corresponding to the plurality of gain bands, where each
 - 15 of the plurality of tone signals has a different frequency and a characteristic corresponding to the power of optical signals in one of the plurality of gain bands corresponding to the each of the plurality of tone signals,
 - and
 - 20 an optical transmission unit which transmits the plurality of tone signals together with optical signals through the optical-fiber transmission line;
 - the optical repeater includes,
 - 25 an optical amplification unit which realizes optical amplification in each of the plurality of gain bands with a gain which is determined based on a

control signal,

a characteristic-signal generation unit which receives the plurality of tone signals, and generates a plurality of characteristic signals each
5 representing the characteristic of one of the plurality of tone signals, and

a gain control unit which compares each of the plurality of characteristic signals with a reference signal, and generates the control signal
10 corresponding to each of the plurality of gain bands so as to equalize the gain in the optical amplification in each of the plurality of gain bands.

2. The optical transmission system according to
15 claim 1, wherein the optical amplification unit injects excitation light into the optical-fiber transmission line, which is used as an amplification medium in the optical amplification.

20 3. The optical transmission system according to claim 1, wherein the characteristic-signal generation unit comprises,

a photoelectric conversion unit which receives the plurality of tone signals, and generates an
25 electric signal representing the plurality of tone signals,

a plurality of frequency filters which respectively extract the plurality of tone signals from

the electric signal, and

a smoothing unit which smoothes the plurality of tone signals extracted by the plurality of frequency filters so as to generate the plurality of
5 characteristic signals.

4. The optical transmission system according to claim 1, wherein the characteristic of each of the plurality of tone signals is the frequency of the each of
10 the plurality of tone signals or a modulation depth with which the each of the plurality of tone signals is modulated,

the tone-signal generation unit decreases the modulation depth of one of the plurality of tone signals
15 or increases a difference between a predetermined frequency and the frequency of the one of the plurality of tone signals in order to increase the gain in the optical amplification in one of the plurality of gain bands corresponding to the one of the plurality of tone signals,
20 and

the tone-signal generation unit increases the modulation depth of one of the plurality of tone signals or decreases a difference between the predetermined frequency and the frequency of the one of the plurality of
25 tone signals in order to decrease the gain in the optical amplification in one of the plurality of gain bands corresponding to the one of the plurality of tone signals.

5. The optical transmission system according to claim 1, wherein the optical amplification unit includes more than two excitation light sources each of which emits
5 excitation light having a different wavelength, and the optical transmission system further comprises an optical multiplexing unit which optically multiplexes the excitation light emitted by the more than two excitation light sources.

10

6. The optical transmission system according to claim 1, further comprising a driving control unit which activates and deactivates the optical amplification unit.

15

7. An optical transmission system comprising:

an optical terminal;

a plurality of optical-fiber transmission lines connected to the optical terminal; and

an optical repeater arranged along the
20 plurality of optical-fiber transmission lines;

the optical terminal includes,

an optical-signal power detection unit which detects power of optical signals transmitted from the optical terminal in each of a plurality of gain bands
25 through each of the plurality of optical-fiber transmission lines,

a tone-signal generation unit which

generates a plurality of tone signals respectively
corresponding to the plurality of gain bands for each of
the plurality of optical-fiber transmission lines, where
each of the plurality of tone signals has a different
5 frequency, and each of the plurality of tone signals for
each of the plurality of optical-fiber transmission lines
has a characteristic corresponding to the power of optical
signals transmitted in one of a plurality of gain bands
corresponding to the each of the plurality of tone signals
10 in the each of the plurality of optical-fiber transmission
lines, and

an optical transmission unit which
transmits the plurality of tone signals together with
optical signals through each of the plurality of optical-
15 fiber transmission lines;

the optical repeater includes,

an optical amplification unit which
realizes optical amplification in each of the plurality of
gain bands with a gain which is determined based on a
20 control signal,

a characteristic-signal generation unit
which receives the plurality of tone signals from each of
the plurality of optical-fiber transmission lines, and
generates a plurality of characteristic signals each
25 representing the characteristic of one of the plurality of
tone signals received from each of the plurality of
optical-fiber transmission lines,

an averaging unit which obtains for each of the plurality of gain bands an average of ones of the plurality of characteristic signals corresponding to both of the plurality of optical-fiber transmission lines and
5 the each of the plurality of gain bands, and

a gain control unit which compares the average with a reference signal, and generates the control signal for each of the plurality of gain bands so as to equalize the gain in the optical amplification in each of
10 the plurality of gain bands.

8. An optical terminal comprising:

an optical-signal power detection unit which detects power of optical signals transmitted from
15 the optical terminal in each of a plurality of gain bands;

a tone-signal generation unit which generates a plurality of tone signals respectively corresponding to the plurality of gain bands, where each of the plurality of tone signals has a different frequency
20 and a characteristic corresponding to the power of optical signals in one of the plurality of gain bands corresponding to the each of the plurality of tone signals; and

an optical transmission unit which
25 transmits the plurality of tone signals together with optical signals through the optical-fiber transmission line.

9. The optical terminal according to claim 8,
wherein the characteristic of each of the plurality of
tone signals is the frequency of the each of the plurality
5 of tone signals or a modulation depth with which the each
of the plurality of tone signals is modulated,

the tone-signal generation unit decreases the
modulation depth of one of the plurality of tone signals
or increases a difference between a predetermined
10 frequency and the frequency of the one of the plurality of
tone signals in order to increase a gain in optical
amplification in one of the plurality of gain bands
corresponding to the one of the plurality of tone signals,
and

15 the tone-signal generation unit increases the
modulation depth of one of the plurality of tone signals
or decreases a difference between the predetermined
frequency and the frequency of the one of the plurality of
tone signals in order to decrease a gain in optical
20 amplification in one of the plurality of gain bands
corresponding to the one of the plurality of tone signals.

10. An optical repeater comprising:

an optical amplification unit which
25 realizes optical amplification in each of a plurality of
gain bands with a gain which is determined based on a
control signal;

a characteristic-signal generation unit which receives a plurality of tone signals, and generates a plurality of characteristic signals each representing a characteristic of one of the plurality of tone signals;

5 and

a gain control unit which compares each of the plurality of characteristic signals with a reference signal, and generates the control signal corresponding to each of the plurality of gain bands so as
10 to equalize the gain in the optical amplification in each of the plurality of gain bands.

11. The optical repeater according to claim 10, wherein the optical amplification unit injects excitation
15 light into an optical-fiber transmission line, which is used as an amplification medium in the optical amplification.

12. The optical repeater according to claim 10,
20 wherein the characteristic-signal generation unit comprises,

a photoelectric conversion unit which receives the plurality of tone signals, and generates an electric signal representing the plurality of tone signals,

25 a plurality of frequency filters which respectively extract the plurality of tone signals from the electric signal, and

a smoothing unit which smoothes the plurality of tone signals extracted by the plurality of frequency filters so as to generate the plurality of characteristic signals.

5

13. The optical repeater according to claim 10, wherein the optical amplification unit includes more than two excitation light sources each of which emits excitation light having a different wavelength, and the optical repeater further comprises an optical multiplexing unit which optically multiplexes the excitation light emitted by the more than two excitation light sources.

14. The optical repeater according to claim 10, further comprising a driving control unit which activates and deactivates the optical amplification unit.

15. An optical repeater being able to be connected to a plurality of optical-fiber transmission lines and comprising:

an optical amplification unit which realizes optical amplification in each of a plurality of gain bands with a gain which is determined based on a control signal,

25 a characteristic-signal generation unit which receives a plurality of tone signals from each of the plurality of optical-fiber transmission lines, and

generates a plurality of characteristic signals each representing a characteristic of one of the plurality of tone signals received from each of the plurality of optical-fiber transmission lines,

5 an averaging unit which obtains for each of the plurality of gain bands an average of ones of the plurality of characteristic signals corresponding to both of the plurality of optical-fiber transmission lines and the each of the plurality of gain bands, and

10 a gain control unit which compares the average with a reference signal, and generates the control signal for each of the plurality of gain bands so as to equalize the gain in the optical amplification in each of the plurality of gain bands.

15

16. An optical transmission system comprising:

an optical terminal;

an optical-fiber transmission line connected to the optical terminal; and

20 an optical repeater arranged along the optical-fiber transmission line;

the optical terminal includes,

an optical-signal power detection unit which detects power of optical signals transmitted from
25 the optical terminal in each of a plurality of gain bands,

a tone-signal generation unit which generates a plurality of tone signals respectively

corresponding to the plurality of gain bands, where each of the plurality of tone signals has a different frequency and a characteristic corresponding to the power of optical signals in one of the plurality of gain bands
5 corresponding to the each of the plurality of tone signals, and

an optical transmission unit which transmits the plurality of tone signals together with optical signals through the optical-fiber transmission
10 line;

the optical repeater includes,

a first optical amplification unit which realizes optical amplification in a first one of the plurality of gain bands with constant light emission,

15 a second optical amplification unit which realizes optical amplification in each of the plurality of gain bands except for the first one of the plurality of gain bands with a gain which is determined based on a control signal,

20 a characteristic-signal generation unit which receives the plurality of tone signals, and generates a plurality of characteristic signals each representing the characteristic of one of the plurality of tone signals, and

25 a gain control unit which compares each of the plurality of characteristic signals corresponding to the plurality of gain bands except for the first one of

the plurality of gain bands, with a reference signal, and generates the control signal corresponding to each of the plurality of gain bands except for the first one of the plurality of gain bands so as to equalize the gain in the optical amplification in each of the plurality of gain bands, where the reference signal is one of the plurality of characteristic signals corresponding to the first one of the plurality of gain bands.

10 17. The optical transmission system according to claim 16, wherein the first optical amplification unit and the second optical amplification unit inject excitation light into the optical-fiber transmission line, which is used as an amplification medium in the optical
15 amplification.

18. The optical transmission system according to claim 16, wherein the characteristic-signal generation unit comprises,

20 a photoelectric conversion unit which receives the plurality of tone signals, and generates an electric signal representing the plurality of tone signals,

 a plurality of frequency filters which respectively extract the plurality of tone signals from
25 the electric signal, and

 a smoothing unit which smoothes the plurality of tone signals extracted by the plurality of

frequency filters so as to generate the plurality of characteristic signals.

19. The optical transmission system according to claim 16, wherein the characteristic of each of the plurality of tone signals is the frequency of the each of the plurality of tone signals or a modulation depth with which the each of the plurality of tone signals is modulated,

the tone-signal generation unit decreases the modulation depth of one of the plurality of tone signals or increases a difference between a predetermined frequency and the frequency of the one of the plurality of tone signals in order to increase the gain in the optical amplification in one of the plurality of gain bands corresponding to the one of the plurality of tone signals, and

the tone-signal generation unit increases the modulation depth of one of the plurality of tone signals or decreases a difference between the predetermined frequency and the frequency of the one of the plurality of tone signals in order to decrease the gain in the optical amplification in one of the plurality of gain bands corresponding to the one of the plurality of tone signals.

20. The optical transmission system according to claim 16, wherein the first optical amplification unit and

the second optical amplification unit include more than two excitation light sources each of which emits excitation light having a different wavelength, and the optical transmission system further comprises an optical
5 multiplexing unit which optically multiplexes the excitation light emitted by the more than two excitation light sources.

21. The optical transmission system according to
10 claim 16, further comprising a driving control unit which activates and deactivates the second optical amplification unit.

22. An optical transmission system comprising:
15 an optical terminal;
a plurality of optical-fiber transmission lines connected to the optical terminal; and
an optical repeater arranged along the plurality of optical-fiber transmission lines;
20 the optical terminal includes,
an optical-signal power detection unit which detects power of optical signals transmitted from the optical terminal in each of a plurality of gain bands through each of the plurality of optical-fiber
25 transmission lines,
a tone-signal generation unit which generates a plurality of tone signals respectively

corresponding to the plurality of gain bands for each of the plurality of optical-fiber transmission lines, where each of the plurality of tone signals has a different frequency, and each of the plurality of tone signals for
 5 each of the plurality of optical-fiber transmission lines has a characteristic corresponding to the power of optical signals transmitted in one of a plurality of gain bands corresponding to the each of the plurality of tone signals in the each of the plurality of optical-fiber transmission
 10 lines, and

an optical transmission unit which transmits the plurality of tone signals together with optical signals through each of the plurality of optical-fiber transmission lines;

15 the optical repeater includes,

a first optical amplification unit which realizes optical amplification in a first one of the plurality of gain bands in each of the plurality of optical-fiber transmission lines with constant light
 20 emission,

a second optical amplification unit which realizes optical amplification in each of the plurality of gain bands except for the first one of the plurality of gain bands in each of the plurality of optical-fiber transmission lines, with a gain which is
 25 determined based on a control signal,

a characteristic-signal generation unit

which receives the plurality of tone signals from each of the plurality of optical-fiber transmission lines, and generates a plurality of characteristic signals each representing the characteristic of one of the plurality of tone signals received from each of the plurality of optical-fiber transmission lines,

an averaging unit which obtains for each of the plurality of gain bands an average of ones of the plurality of characteristic signals corresponding to both of the plurality of optical-fiber transmission lines and the each of the plurality of gain bands, and

a gain control unit which compares the average obtained for each of the plurality of gain bands except for the first one of the plurality of gain bands, with a reference signal, and generates the control signal for each of the plurality of gain bands except for the first one of the plurality of gain bands so as to equalize the gain in the optical amplification in each of the plurality of gain bands, where the reference signal is the average obtained for the first one of the plurality of gain bands.

23. An optical terminal comprising:

an optical-signal power detection unit which detects power of optical signals transmitted from the optical terminal in each of a plurality of gain bands;

a tone-signal generation unit which

generates a plurality of tone signals respectively corresponding to the plurality of gain bands, where each of the plurality of tone signals has a different frequency and a characteristic corresponding to the power of optical signals in one of the plurality of gain bands corresponding to the each of the plurality of tone signals; and

an optical transmission unit which transmits the plurality of tone signals together with optical signals through the optical-fiber transmission line.

24. The optical terminal according to claim 23, wherein the characteristic of each of the plurality of tone signals is the frequency of the each of the plurality of tone signals or a modulation depth with which the each of the plurality of tone signals is modulated,

the tone-signal generation unit decreases the modulation depth of one of the plurality of tone signals or increases a difference between a predetermined frequency and the frequency of the one of the plurality of tone signals in order to increase a gain in optical amplification in one of the plurality of gain bands corresponding to the one of the plurality of tone signals, and

the tone-signal generation unit increases the modulation depth of one of the plurality of tone signals

or decreases a difference between the predetermined frequency and the frequency of the one of the plurality of tone signals in order to decrease a gain in optical amplification in one of the plurality of gain bands
5 corresponding to the one of the plurality of tone signals.

25. An optical repeater comprising:

a first optical amplification unit which realizes optical amplification in a first one of a
10 plurality of gain bands with constant light emission,

a second optical amplification unit which realizes optical amplification in each of the plurality of gain bands except for the first one of the plurality of gain bands with a gain which is determined
15 based on a control signal,

a characteristic-signal generation unit which receives a plurality of tone signals, and generates a plurality of characteristic signals each representing a characteristic of one of the plurality of tone signals,
20 and

a gain control unit which compares each of the plurality of characteristic signals corresponding to the plurality of gain bands except for the first one of the plurality of gain bands, with a reference signal, and
25 generates the control signal corresponding to each of the plurality of gain bands except for the first one of the plurality of gain bands so as to equalize the gain in the

optical amplification in each of the plurality of gain bands, where the reference signal is one of the plurality of characteristic signals corresponding to the first one of the plurality of gain bands.

5

26. The optical repeater according to claim 25, wherein the first optical amplification unit and the second optical amplification unit inject excitation light into the optical-fiber transmission line, which is used as an amplification medium in the optical amplification.

27. The optical repeater according to claim 25, wherein the characteristic-signal generation unit comprises,

15 a photoelectric conversion unit which receives the plurality of tone signals, and generates an electric signal representing the plurality of tone signals, a plurality of frequency filters which respectively extract the plurality of tone signals from the electric signal, and

20 a smoothing unit which smoothes the plurality of tone signals extracted by the plurality of frequency filters so as to generate the plurality of characteristic signals.

25

28. The optical repeater according to claim 25, wherein the first optical amplification unit and the

second optical amplification unit include more than two
excitation light sources each of which emits excitation
light having a different wavelength, and the optical
repeater further comprises an optical multiplexing unit
5 which optically multiplexes the excitation light emitted
by the more than two excitation light sources.

29. The optical repeater according to claim 25,
further comprising a driving control unit which activates
10 and deactivates the second optical amplification unit.

30. An optical repeater being able to be connected
to a plurality of optical-fiber transmission lines and
comprising:

15 a first optical amplification unit which
realizes optical amplification in a first one of a
plurality of gain bands in each of the plurality of
optical-fiber transmission lines with constant light
emission,

20 a second optical amplification unit
which realizes optical amplification in each of the
plurality of gain bands except for the first one of the
plurality of gain bands in each of the plurality of
optical-fiber transmission lines, with a gain which is
25 determined based on a control signal,

a characteristic-signal generation unit
which receives a plurality of tone signals from each of

the plurality of optical-fiber transmission lines, and
generates a plurality of characteristic signals each
representing a characteristic of one of the plurality of
tone signals received from each of the plurality of
5 optical-fiber transmission lines,

an averaging unit which obtains for each
of the plurality of gain bands an average of ones of the
plurality of characteristic signals corresponding to both
of the plurality of optical-fiber transmission lines and
10 the each of the plurality of gain bands, and

a gain control unit which compares the
average obtained for each of the plurality of gain bands
except for the first one of the plurality of gain bands,
with a reference signal, and generates the control signal
15 for each of the plurality of gain bands except for the
first one of the plurality of gain bands so as to equalize
the gain in the optical amplification in each of the
plurality of gain bands, where the reference signal is the
average obtained for the first one of the plurality of
20 gain bands.
